

FUSION 360:

ONE LITRE WATER BOTTLE:

This project showcases a 3D water bottle model created using Autodesk Fusion 360, focusing on precision sketching, solid modeling, and realistic design techniques. The bottle was developed by first sketching a detailed side profile and converting it into a 3D form using the revolve feature.

Advanced tools such as shelling, filleting, and extrusion were applied to create a hollow interior, smooth edges,

and a functional neck structure.

Attention was given to proportions, symmetry, and material appearance to simulate a real-world product. This project demonstrates foundational CAD skills including parametric design, dimensional accuracy, and visualization, highlighting the ability to transform conceptual sketches into a refined 3D model suitable for product design and prototyping.
